Sustainable Architectural Elements in the Buildings of Buid Period with Emphasis on the Aesthetics Values of Designs

Abstract

The reign of Buiids (322-448 AH) has been one of the most significant periods in the history of Iran in terms of culture and civilization. There are works left from this period that show the architecture of this period. A study of the nature of architecture of this period and its elements can reveal the course of architecture in Iran and its developments in this period. This research has been done based on a descriptive-analytical method and library information collection technique. The research findings indicate that in the Buid period, the architecture of early Islam with the cultural changes of the Sassanid period and the use of cultural enhancements and social and religious perceptions had fundamental elements in the form of innovation. In a way that is both reminiscent of the past and expresses the phenomenon of diversity in the evolution of Iranian architecture. Early Islamic architectural materials relying on environmental conditions include layers, clay, brick and stone. In most parts of Iran, the use of clay and earth has been constantly used from ancient times until now since the materials have always been ecological and were supplied from the same environment and surroundings. The beautifications of the early Islamic buildings rely on the decorations of earlier periods, in other words, they are a long historical painting, as it was used in the first prehistoric temples. In the Buid period, there is a combination of architecture derived from Islamic culture and architecture left over from the ancient Iranian period, which can be reflected in the use of decorative motifs along with ancient architectural materials.

Research aims:
1. Recognition of sustainable architectural elements in the buildings of Buid period.
2. A study of the aesthetics of patterns in the architecture of the Buid period.

Research questions:
1. What features and elements did architecture have in the Buid period?
2. What is the place of motifs and designs in the architecture of the Buid period?

Keywords: Sustainable Architecture, Buid Period, Architectural Elements, Aesthetics.
Introduction

Architecture is one of the most important branches of art in human civilization, which has attracted the attention of many human societies since the first millennia. Over time, efforts have been made to develop and expand it. Architecture is not just a building, but a thought. With the advent of Islam in the Arabian Peninsula, a special and unique style entered the field of architecture, which has been effective and influential in the face of neighboring cultures, so it can be said that along the spread of Islam, architecture and art have the same shape and color. It became religious and widely associated with the religious ideas of architects in the borders of Islamic Iran. This effect is specifically seen in the construction of Islamic buildings. The integration of the features and elements of Iranian architecture with Islamic in architecture in the first centuries of Islam has led to the stability of a number of such works. Therefore, recognizing the elements of sustainable architecture in this period is important. Achieving a comprehensive phenomenology about the stable elements used in the architecture of buildings from the first to the fifth century AH, which leads to creating a source for identifying and introducing the architectural works of this period. Since a large part of the art of Islamic architecture is related to the first five centuries of Islam, any subject that somehow provides information in this field is imperative because these works, in addition to a volume of research included in the field of phenomenology, they also have special techniques of decoration that make them unique.

A review of the researches and studies related to the subject of the present research shows that the researches in this field have paid attention to the phenomenon of architecture in the Islamic period from different aspects. Rice (2014) in a book entitled "Islamic Art", Noor al-Rifa'i (2015) in a book entitled "History of Art in Islamic Lands" Mohammad Yousef Kiani (1398) in a book entitled "Architecture of Iran in the Islamic period" respectively. Study: How the formation and growth of medieval architectural heritage; Islamic architecture, painting and pottery have divided Islamic arts and under each title, the changes and developments and works of each field of art in the periods of Islamic history are regularly reviewed and expressed, and finally the architecture of mosques, tombs, schools, Hosseiniyahs, Takayas, mosques, forts, stairs, reservoirs, baths, caravanserais, palaces, minarets and then the formation of Islamic architecture in Iran; Arcs in Islamic architecture; Domes in Islamic architecture; Architects, masters of the Islamic era, artists of the Islamic era. Examining the background of studies conducted on the building, it seems that most researchers have focused on decorations from the perspective of more prominent patterns and have expressed the quality of patterns and their analysis. Therefore, there is a research gap in the field of phenomenology that this research can be useful in obtaining more comprehensive information. The present research has been done by descriptive and analytical method and relying on library data and field observations.

Conclusion

The study of a number of the works and buildings left over from the architecture of the Buiid period indicates the nature of the architecture of this historical period. During the Buiid period, which can be said to be an important stage in the history of Iranian art and culture, many buildings were created due to the interest and support of the Buiid rulers. Due to the fact that the Buiid dynast was a Muslim and a Shiite monarchy, the most important architectural features in this historical period were mosques. Examining the constituent elements of mosque architecture presented that a number of its components are derived from Iranian culture and architecture and some are derived from Islamic culture and its specific requirements. Remains from the fourth century AH, which can be seen today in some Iranian provinces such as Isfahan and Fars, designate the strength of this building. From the aesthetic point of view, the use of herbal, Islamic
and geometric patterns is one of the characteristics of this period, which is undoubtedly the architectural heritage of the ancient period, particularly the Sassanid period. With this change, the elegance of the motifs in the works of the Buidid period originated from Islamic culture. The obvious manifestation is the inscriptions on which the names of God or the verses of the Qur'an are engraved and occasionally is seen in the altars, porches and arches of the entrance or interior and dazzles the eyes of every viewer. Slowly the use of domes, porches and courtyards is undoubtedly taken from ancient architecture. Architecture, part of which has been extended to the Islamic period due to its geographical location and material requirements or the interests of the kings. The remaining plasterwork from the architecture of the Buidid period is a clear manifestation of the continuity of an element of the architecture of the ancient period. In this period, plastering and decorating the exterior with bricks has given a distinct feature and beauty to the architecture of this period, and this issue has created a unique nature for the architecture of the Buidid period. With these interpretations, it should be said that in the issue of architectural phenomenology in any historical period, the recognition of cultural, geographical and political elements bestows an imperative role.
